each submodule of S is M-projective. Let φ be a homomorphism from A to S, then A/Ker φ is isomorphic to a submodule of S, and so A/Ker φ is M-projective and semisimple. Moreover A is M-projective and, since noisimple. Moreover A is M-projective and, since noisimple for A's finitely generated. Hence by [6, 18.3] the exact sequence

A COMPLETE PROOF OF BEAUVILLE'S CONJECTURE

splits, i.e. $A = \operatorname{Ker} \varphi \oplus U$ for some submodule U of A with $U \cong A/\operatorname{Ker} \varphi$. In particular, U is an M - injective semisimple submodule of A. But we assumed above that each simple submodule of A is not M-injective, hence U = 0, i.e. $\varphi(A) = 0$. From this we easily derive that for each $f \in \operatorname{End}_R(M)$, $f(A) \subseteq A$.

The proof of Corollary is complete.

Let $f: X \to \mathbf{P}^1$ be a non isotrivial semi-stable fibration over the projective line whose generic fibre is a complex algebraic curve of genus $g \ge 1$. Then Beauville's theorem ([1]) asserts that $s \ge 4$, where s denotes the number of singular fibres on X.

The aim of this note is to give a proof of the following statement conjectured by A. Beauville (*loc. cit.*)

Acknowledgement. The author would like to express his thanks to Professor Dinh Van Huynh for raising quest 1 < g if $2 \le s^{-1}$ (subsection of the section of the secti

For convenience we shall prove this theorem in a series of several claims below.

1. Xiao's equality ([2]). Denote by ω the relative canonical class of f and assume that s = 4. Then $\omega^2 = 4(g-1)$ (1)

The idea of proving this equality is to apply the Sakai-Miyaoka inequality in the following form.

2. The Sakai-Miyaoka inequality ([3]). Let $f: X \to B$ be a semi-stable fibration with g > 1 and $q = g(B) \ge 1$ then

$$\sum_{i} 3\left(r_{i}+1-\frac{1}{r_{i}+1}\right) \leq 3c_{2}(X)-c_{1}^{2}(X)$$
(2)

where c_1, c_2 denote Chern's classes of X and the sum is taken over all chains of (-2)-curves on X corresponding to singularities p_i of the type A_{r_i} .

A complete proof of Beauville's conjecture

3. The beginning of the proof. Take a cyclic covering of degree $n: B_n \to \mathbf{P}^1$ (totally) branched over s critical points of \mathbf{P}^1 , i.e., $2g(B_n) - 2 = -2n + (n-1)s$ by the Riemann-Hurwitz formula. Let X_n be the relatively minimal resolution of $X \times_{\mathbf{P}^1} B_n$. Now we apply (2) to X_n

$$\sum_{i} 3\left(\widetilde{r}_i + 1 - \frac{1}{\widetilde{r}_i + 1}\right) \leq 3c_2(X_n) - c_1^2(X_n) \tag{3}$$

where p_i has the type $A_{\widetilde{r_i}}$ on X_n . By an easy computation we have the following equalities

1)
$$\widetilde{r}_i + 1 = n(r_i + 1)$$
,

2)
$$c_1^2(X_n) = n\omega^2 + 2(ns - 2n - s)(2g - 2),$$

3)
$$c_2(X_n) = n\delta + (ns - 2n - s)(2q - 2)$$
,

A. Beauville, Le nombre minimum de fibres singulières d'une courbe stoble sur P1, Astérise arahw

 $\delta := {}^{\#} \{ \text{double points of singular fibres on } X \}$. IV grs (1891)

Thus by substituting these equalities in (3) we obtain

$$s(2g-2) - \frac{3\delta}{n} \le n \left[(2g-2)(s-2) - \omega^2 \right].$$
 (4)

4. The end of the proof. Now putting s = 4 in (4) and taking into account Xiao's equality (1) one has 3δ

$$8(g-1)-\frac{3\delta}{n}\leq 0.$$

Evidently the latter is possible as $n \to \infty$ if and only if g = 1. This completes the proof of the theorem.

5. Remarks.

1) It is not difficult to see that (4) combined with Xiao's inequality for the slope of f (cf. [4]) implies Xiao's equality (1) for the case s = 4 which actually does not occur in view of our theorem above.

2) The idea used in the proof above enables us to get the following variant of the canonical class inequality. Let $f: X \to B$ be as in 2. with g > 1. Then there exists a universal constant A = A(q,s) < 2q - 2 + s (effectively computed by q and s) such that

$$\omega^2 \leq A(2g-2).$$

A detailed version with other applications will appear somewhere else. Acknowledgement. The contents of this note were communicated by the author to Prof. A. Beauville, Prof. M.-H. Saito and Prof. S. Ishii in the fax-messages dated January 15, 1994.

I am grateful to Prof. A. Beauville for the greatly valuable correspondence and communicating the result of G. Xiao. My special thanks are due to Prof. M.-H. Saito, Prof. S. Ishii, Prof. M. Oka and Prof. L.V. Thanh for many stimulating discussions. In particular discussions with M.-H. Saito of his interesting example of genus two fibration with s = 5 turned out very useful for understanding the essence of the conjecture.
